1.7.13 I ASSISTANT RESPONSE . . . 81
1.7.14 I ASSISTANT RESPONSE . . . 82
1.7.15 I ASSISTANT RESPONSE . . . 82
1.7.16 . Bucket Boundaries for ‘title.id‘ Column (101 Values / 100 Buckets) . . . 83
1.7.17 . Bucket Boundaries for ‘title.title‘ Column (101 Values / 100 Buckets) . . . 85
1.7.18 it Update Summary . . . 87
1.8 tep 8: USER PROMPT . . . 87
1.8.1 I ASSISTANT RESPONSE . . . 87
1.8.2 I ASSISTANT RESPONSE . . . 87
1.8.3 I ASSISTANT RESPONSE . . . 87
1.8.4 I ASSISTANT RESPONSE . . . 96
1.8.5 I ASSISTANT RESPONSE . . . 96
1.8.6 I ASSISTANT RESPONSE . . . 97
1.8.7 . Mathematical Formulas & Definitions . . . 97
1.8.8 . Numerical Calculations for the Benchmark Queries . . . 97
1.8.9 . Max Selectivity Error . . . 98
1.8.10 . How PostgreSQL Computes the Estimate Internally (Linear Interpolation) . . . 98
1.9 tep 9: USER PROMPT . . . 99
1.9.1 I ASSISTANT RESPONSE . . . 99
1.9.2 . The Key Clarification: 1/100 is **1.0%**, Not 0.1% . . . 99
1.9.3 . Checking the Measured Error Against the Bound . . . 99
1.9.4 . Why is the Error 0.84% (and not 0% or exactly 1.0%)? . . . 99
1.9.5 ummary Table . . . 100
1.10 tep 10: USER PROMPT . . . 100
1.10.1 I ASSISTANT RESPONSE . . . 100
1.10.2 I ASSISTANT RESPONSE . . . 100
1.10.3 I ASSISTANT RESPONSE . . . 101
1.10.4 I ASSISTANT RESPONSE . . . 101
1.10.5 I ASSISTANT RESPONSE . . . 101
1.10.6 ummary of Actions: . . . 101
1.11 tep 11: USER PROMPT . . . 102
1.11.1 I ASSISTANT RESPONSE . . . 102
1.11.2 I ASSISTANT RESPONSE . . . 104
1.11.3 I ASSISTANT RESPONSE . . . 107
1.11.4 I ASSISTANT RESPONSE . . . 109
1.11.5 . Max Selectivity Error . . . 110
1.11.6 : Selectivity Estimation for Text Columns . . . 110
1.11.7 . Sample Size vs Time Relationship Plot . . . 114
1.11.8 I ASSISTANT RESPONSE . . . 114
1.11.9 I ASSISTANT RESPONSE . . . 114
1.11.10 I ASSISTANT RESPONSE . . . 115
1.11.11 I ASSISTANT RESPONSE . . . 115
1.11.12 hat Was Causing the Issue on GitHub: . . . 115
1.11.13 ix Applied: . . . 115
1.12 tep 12: USER PROMPT . . . 116
1.12.1 I ASSISTANT RESPONSE . . . 116
1.12.2 I ASSISTANT RESPONSE . . . 119
1.12.3 . Max Selectivity Error . . . 119
1.12.4 . Sample Size vs Time Relationship Plot . . . 121
1.12.5 I ASSISTANT RESPONSE . . . 121

1.12.6 I ASSISTANT RESPONSE 122
1.12.7 I ASSISTANT RESPONSE 122
1.12.8 I ASSISTANT RESPONSE 122
1.12.9 Root Cause of the Issue: 122
1.12.10 Solution Applied: 123

1 LLM Conversation Log

This document contains the complete record of user prompts and AI assistant responses for ADBMS Assignment 0 & 1.

1.1 tep 1: USER PROMPT

```
<USER_REQUEST>
there is a job database
i have to load that into postgres
help me with that
see @[Assignment 1 Histogram.pdf] for reference

</USER_REQUEST>
<ADDITIONAL_METADATA>
The current local time is: 2026-08-29T16:01:38+05:30.

The user has mentioned some items in the form @[ITEM]. Here is extra
   information about the items that were mentioned by the user, in the
   order that they appear:

@[Assignment 1 Histogram.pdf] is a [File]:
/home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/Assignment 1 Histogram.
   pdf
</ADDITIONAL_METADATA>
<USER_SETTINGS_CHANGE>
The user changed setting ‘Model Selection‘ from None to Gemini 3.6 Flash (
   High). No need to comment on this change if the user doesn’t ask about
   it. If reporting what model you are, please use a human readable name
   instead of the exact string.
</USER_SETTINGS_CHANGE>
```

1.1.1 I ASSISTANT RESPONSE

Created At: 2026-08-29T10:31:41Z
Completed At: 2026-08-29T10:31:41Z
"name":"Assignment 1 Histogram.pdf","sizeBytes":"76337"

1.1.4 I ASSISTANT RESPONSE

Created At: 2026-08-29T10:31:47Z
Completed At: 2026-08-29T10:31:47Z
File Path: `file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/job/job/README`
Total Lines: 59
Total Bytes: 2398
Showing lines 1 to 59
The following code has been modified to include a line number before every line, in the format: <line_number>: <original_line>. Please note that any changes targeting the original code should remove the line number, colon, and leading space.

1: This package contains the Join Order Benchmark (JOB) queries from:
2:
3: "How Good Are Query Optimizers, Really?"
4: by Viktor Leis, Andrey Gubichev, Atans Mirchev, Peter Boncz, Alfons Kemper, Thomas Neumann
5: PVLDB Volume 9, No. 3, 2015
6:
7: IMDB Data Set
8: ————————-
9:
10: The CSV files used in the paper, which are from May 2013, can be found
11: at http://event.cwi.nl/da/job/imdb.tgz
12:
13: The license and links to the current version IMDB data set can be
14: found at http://www.imdb.com/interfaces
15: Step-by-step instructions:
16: 1. download *gz files (unpacking not necessary)
17: wget ftp://ftp.fu-berlin.de/pub/misc/movies/database/*gz
18: 2. download and unpack imdbpy and the imdbpy2sql.py script
19: wget https://bitbucket.org/alberanid/imdbpy/get/5.0.zip
20: 3. create PostgreSQL database (e.g., name imdbload):
21: createdb imdbload
22: 4. transform *gz files to relational schema (takes a while)
23: imdbpy2sql.py -d PATH_TO_GZ_FILES -u postgres://username:password@hostname/imdbload

24:
25: Now you should have a PostgreSQL database named "imdbload" with the
26: imdb data. Note that this database has some secondary indexes (but not
27: on all foreign key attributes). You can export all tables to CSV:
28:
29: aka_name to 'PATH/aka_name.csv' csv
30: aka_title to 'PATH/aka_title.csv' csv
31: cast_info to 'PATH/cast_info.csv' csv
32: char_name to 'PATH/char_name.csv' csv
33: comp_cast_type to 'PATH/comp_cast_type.csv' csv
34: company_name to 'PATH/company_name.csv' csv
35: company_type to 'PATH/company_type.csv' csv
36: complete_cast to 'PATH/complete_cast.csv' csv
37: info_type to 'PATH/info_type.csv' csv
38: keyword to 'PATH/keyword.csv' csv
39: kind_type to 'PATH/kind_type.csv' csv
40: link_type to 'PATH/link_type.csv' csv
41: movie_companies to 'PATH/movie_companies.csv' csv
42: movie_info to 'PATH/movie_info.csv' csv
43: movie_info_idx to 'PATH/movie_info_idx.csv' csv
44: movie_keyword to 'PATH/movie_keyword.csv' csv
45: movie_link to 'PATH/movie_link.csv' csv
46: name to 'PATH/name.csv' csv
47: person_info to 'PATH/person_info.csv' csv
48: role_type to 'PATH/role_type.csv' csv
49: title to 'PATH/title.csv' csv
50:
51: To import the CSV files to another database, create all tables (see
52: schema.sql and optionally fkindexes.sql) and run the same copy as
53: above statements but replace the keyword "to" by "from".
54:
55: Questions
56: ———
57:
58: Contact Viktor Leis (leis@in.tum.de) if you have any questions.
59:

1.1.25 I ASSISTANT RESPONSE

I have created the plan and automated loading scripts for importing the **Join Order Benchmark (JOB)** database into PostgreSQL and generating the report details required by **Assignment 0** in `Assignment 1 Histogram.pdf`.

Please review the [implementation_plan.md](file:///home/jdsb/.gemini/antigravity/brain/e4f20c24-9886-4d61-9b7c-8ff33e56ef4c/implementation_plan.md) artifact for full details.

1.1.26 ey Prepared Files in Workspace:

1. **[load_job.sh](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/load_job.s**
Executable bash script that extracts `imdb.tgz`, creates `imdbload` database, imports all 21 CSV tables, builds foreign key indexes, and runs `ANALYZE`.

2. **[import_job.sql](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/imp**
SQL script containing the schema creation (`job/job/schema.sql`), statements for all 21 tables, index creation (`job/job/fkindexes.sql`), and `ANALYZE`.

3. **[get_cardinalities.sql](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1**
SQL query script to retrieve table names, primary key column names (`id`), and row cardinalities (`count(*)`) across all tables.

1.1.27 ommands to Run on Your Terminal:

ption A: One-Command Automated Execution Run the shell script:

```
./load_job.sh
```

ption B: Step-by-Step Manual Execution If you prefer running commands individually:

1. **Extract dataset** (if `imdb.tgz` download is complete):

```
tar -xzf imdb.tgz
```

2. **Create Database**:

```
createdb imdbload
```

3. **Load Schema, Data, Indexes & Build Histograms**:

```
psql -d imdbload -f import_job.sql
```

4. **Get Table Cardinalities for Assignment Report**:

```
psql -d imdbload -f get_cardinalities.sql
```

1.1.28 ystem Setup Details (For Assignment Report - "Setup"):

- **CPU Model & Cores**: 13th Gen Intel(R) Core(TM) i3-1315U (6 cores, 8 threads)
- **RAM**: 14 GiB
- **HDD / Storage**: 456 GiB NVMe SSD
- **OS Version**: Ubuntu 26.04 LTS
- **PostgreSQL Engine Version**: PostgreSQL 18.6

1.2 tep 2: USER PROMPT

```
<USER_REQUEST>
why i need imdb dataset
i downloaded job dataset
where it is written to download
</USER_REQUEST>
<ADDITIONAL_METADATA>
The current local time is: 2026-08-29T16:06:45+05:30.
</ADDITIONAL_METADATA>
```

1.2.1 I ASSISTANT RESPONSE

1.2.2 hy the IMDB Dataset is Needed

The **Join Order Benchmark (JOB)** is a database benchmark based on real-world data from the **IMDB (Internet Movie Database)**.

1. `job.tgz` **contains only queries and schemas**:
The `job.tgz` file you downloaded only contains:

- `schema.sql` (creates empty table structures like `title`, `cast_info`, `movie_info`, etc.)
- `1a.sql` to `33c.sql` (the 113 benchmark SQL queries)
- `fkindexes.sql` (indexes)

It **does not contain the actual data (rows)** to populate the tables.

2. `imdb.tgz` **contains the actual table data**:
The actual table data (the 21 `.csv` files containing all movies, actors, roles, etc.) is in `imdb.tgz`. Without this CSV data, your PostgreSQL tables will be completely empty.

1.2.3 here it is Written

1. **In `Assignment 1 Histogram.pdf` (Page 1 under Assignment 0)**:
> *"load the JOB database (https://event.cwi.nl/da/job/)."*

2. **In [job/job/README](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A L11)**:
> **IMDB Data Set**
> The CSV files used in the paper, which are from May 2013, can be found at **http://event.cwi.nl/da/job/in**

1.2.4 ummary

- `job.tgz` = Database schema & benchmark SQL queries (Empty structure)
- `imdb.tgz` = CSV data files (1.2 GB compressed) to populate the database tables

Once `imdb.tgz` is uncompressed into the folder, running `./load_job.sh` will populate the database and run `ANALYZE` so histograms can be built for your assignment!

1.2.5 I ASSISTANT RESPONSE

Great news! The download of `imdb.tgz` **(1.18 GB)** has completed successfully in your workspace directory.

Everything is set up and ready to load into PostgreSQL.

1.2.6 hat to run next in your terminal:

```
./load_job.sh
```

1.2.7 hat this script will do automatically:

1. Extract `imdb.tgz` to get all 21 CSV files.
2. Create the `imdbload` PostgreSQL database (if it doesn't already exist).
3. Execute [import_job.sql](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/import_j to build the schema, load all CSV files via , and build foreign key indexes.
4. Run `ANALYZE` on all tables so PostgreSQL generates internal histograms for Assignment 1.

Once completed, you can run:

```
psql -d imdbload -f get_cardinalities.sql
```

to display the primary keys and cardinalities (`count(*)`) for all tables needed for your Assignment 0 report.

1.3 tep 3: USER PROMPT

```
<USER_REQUEST>
adbms/A1 on      main [?]
    ./load_job.sh
=== 1. Checking IMDB CSV dataset ===
Extracting imdb.tgz...
=== 2. Creating Database 'imdbload' if not present ===
psql: error: connection to server on socket "/var/run/postgresql/.s.PGSQL

</ADDITIONAL_METADATA>
```

1.3.1 I ASSISTANT RESPONSE

Created At: 2026-08-29T11:36:57Z

Completed At: 2026-08-29T11:36:57Z

Created file file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/load_job.sh with requested content.

If relevant, proactively run terminal commands to execute this code for the USER. Don't ask for permission.

1.3.2 I ASSISTANT RESPONSE

1.3.3 hy This Happened

On Ubuntu, PostgreSQL uses **Peer Authentication** by default. This means PostgreSQL expects a database role matching your system's username (`jdsb`). Since the PostgreSQL role `jdsb` does not exist yet in PostgreSQL, connection attempts were rejected.

1.3.4 olution (One-Time Setup)

Run these **two commands** in your terminal to create your PostgreSQL role and database:

```
# 1. Create a PostgreSQL role matching your system user 'jdsb'
sudo -u postgres createuser -s jdsb

# 2. Create the 'imdbload' database owned by 'jdsb'
sudo -u postgres createdb imdbload -O jdsb
```

1.3.5 tep 2: Run the loader script

Now run `./load_job.sh` again:

```
./load_job.sh
```

It will proceed to import all 21 CSV tables into PostgreSQL and run `ANALYZE` for histogram generation!

1.4 tep 4: USER PROMPT

```
<USER_REQUEST>
    ./load_job.sh
=== 1. Checking IMDB CSV dataset ===
=== 2. Creating Database 'imdbload' if not present ===
Database 'imdbload' already exists.

1.4.39 I ASSISTANT RESPONSE

All code, experiment pipelines, visualizations, and documentation files required by **Assignment 0** and **Assignment 1** in `Assignment 1 Histogram.pdf` have been fully generated and verified against your PostgreSQL `imdbload` database.

1.4.40 reated Submission Files & Artifacts

Document / Code File
**[Assignment_Report.docx](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/Assignment_Report
**[LLM_Conversations.docx](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/LLM_Conversation
[solution_q1.py](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/solution_q1.py)

1.4.41 ummary of Results & Key Answers

Assignment 0: Setup & Database*

- **Machine Specs**: 13th Gen Intel Core i3-1315U (6 cores/8 threads), 14 GiB RAM, 456 GiB NVMe SSD, Ubuntu 26.04 LTS, PostgreSQL 18.6.
- **Database**: Join Order Benchmark (2013 Snapshot), 21 tables, **2,528,312 rows** in `title`, **36,244,344 rows** in `cast_info`. Primary Key column for all 21 tables is `id`.

Assignment 1: Question 1 (PostgreSQL Histograms)* 1. **Histogram Type**: Equi-Depth (Equi-Height) Histogram with Most Common Values (MCV) list.

2. **Number of Buckets**: **100 buckets** (101 boundary values in `pg_stats.histogram_bounds`).

3. **Text Encoding**: Text strings are sorted lexicographically; initial byte prefixes are converted into float range $[0.0, 1.0]$ for percentile quantile boundary selection.

4. **Selectivity Analysis**:

- `SELECT * FROM title WHERE title.title < 'Race';`:
- **Actual Selectivity**: `0.758665` (1,918,141 / 2,528,312 rows)
- **Estimated Selectivity**: `0.760177` (1,921,965 rows)
- **Absolute Error**: `0.001512` (0.20% relative error)
- `SELECT * FROM title WHERE title.id < 350000;`:
- **Actual Selectivity**: `0.138432` (349,999 / 2,528,312 rows)
- **Estimated Selectivity**: `0.140982` (356,446 rows)
- **Absolute Error**: `0.002550` (1.84% relative error)

Assignment 1: Question 2 (Optimal Serial Histogram - $B = 20$ Buckets)* 1. **Build Timings & Errors**:

- $N = 1000$: Build Time = **0.4712s**, Max Selectivity Error = **0.004155**
- $N = 3000$: Build Time = **0.8934s**, Max Selectivity Error = **0.004476**
- $N = 5000$: Build Time = **2.2051s**, Max Selectivity Error = **0.002263** 2. **Full Table Extrapolation ($N = 2,528,312$)**:
- Linear regression model $T(N) = m \cdot N + c$ ($m = 0.00043346$, $c = -0.110482$)
- Extrapolated Build Time for Full Table: **1095.82 seconds (18.26 minutes)**. 3. **Bucket Count Tradeoffs**:
- **Fewer Buckets**: Faster build time & lower memory footprint, but higher selectivity error.
- **More Buckets**: Significantly lower selectivity error, but higher construction time & memory overhead in catalog.

1.4.42 isualization Plots Generated

1. [q1_histogram_id.png](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/q1_histogram_
(Equi-depth histogram for `id`)
2. [q1_histogram_title.png](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/q1_histo
(Equi-depth histogram for `title`)
3. [q2_histogram_id_3000.png](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/q2_h
(Horizontal bar plot for `id`, $N = 3000$)
4. [q2_histogram_title_3000.png](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/q2
(Horizontal bar plot for `title`, $N = 3000$)
5. [q2_sample_size_vs_time.png](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/q2
(Sample size vs Build time plot with linear trend line)
6. [q2_sample_size_vs_error.png](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/q2
(Sample size vs Max Selectivity Error)

1.4.43 ow to Run in a Single Command

```
./venv/bin/python3 generate_report.py && ./venv/bin/python3 export_llm_chat
   .py && ./venv/bin/python3 convert_to_doc.py
```

1.5 tep 5: USER PROMPT

```
<USER_REQUEST>
now you have to structurize this a little and create gitignore if any
then add , commit , push
as i will submit git repo only
</USER_REQUEST>
<ADDITIONAL_METADATA>
The current local time is: 2026-08-29T17:23:03+05:30.
</ADDITIONAL_METADATA>
```

1.5.9 I ASSISTANT RESPONSE

Created At: 2026-08-29T11:54:31Z
Completed At: 2026-08-29T11:55:02Z
The command completed successfully.
Output:
On branch main
Your branch is up to date with 'origin/main'.
nothing to commit, working tree clean

1.5.10 I ASSISTANT RESPONSE

All files have been organized, `.gitignore` configured, committed, and pushed to your remote repository.

1.5.11 ummary of Git Actions Taken:

1. **Created [.gitignore](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/.giti**

- Excludes virtual environments (`venv/`), Python cache (`__pycache__/`), OS metadata (`.DS_Store`, `._*`), and large datasets (`*.csv`, `imdb.tgz`, `job.tgz`) to adhere to GitHub's file size limits. 2. **Created [README.md](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A**

- Contains single-command execution instructions and parameter documentation as requested in the assignment instructions. 3. **Staged, Committed, & Pushed**:
- **Branch**: `main`
- **Repository**: `git@github.com:Jdsb06/adbms.git`
- **Commit Message**: `"Add ADBMS Assignment 0 & 1 solution, loading automation, plots, reports and LLM logs"`
- **Status**: `working tree clean` (100% up to date with remote)

1.5.12 ubmitted Repository Contents:

- `Assignment_Report.docx` / `Assignment_Report.md`: Main assignment document.
- `LLM_Conversations.docx` / `LLM_Conversations.md`: AI conversation log.
- `load_job.sh`: One-command database loading script.
- `solution_q1.py` & `solution_q2.py`: Complete histogram algorithms & selectivity calculations.
- `generate_report.py`, `export_llm_chat.py`, `convert_to_doc.py`: Automated build & export scripts.
- `q1_*.png` & `q2_*.png`: All 6 plot visualizations.

            q2_sample_size_vs_error.png

        data/                             # IMDB dataset CSVs & archives (
   gitignored)
            imdb.tgz
            *.csv

        job/                              # Join Order Benchmark (JOB)
   queries & schema
        .gitignore                        # Git exclusion rules
        README.md                         # Documentation & execution
   instructions
```

1.6.32 Updated Execution Commands

From the root directory:

```
# 1. Load database into PostgreSQL
./scripts/load_job.sh

# 2. Run complete benchmark pipeline, generate plots & compile Word reports
    (.docx)
```

```
./venv/bin/python3 scripts/generate_report.py && ./venv/bin/python3 scripts
   /export_llm_chat.py && ./venv/bin/python3 scripts/convert_to_doc.py
```

1.6.33 Git Status

- **Branch**: `main`
- **Remote**: `git@github.com:Jdsb06/adbms.git`
- **Status**: `working tree clean` (pushed and up to date)

1.7 tep 7: USER PROMPT

```
<USER_REQUEST>
SELECT
    attname,
    null_frac,
    n_distinct,
    most_common_vals,
    most_common_freqs,
    histogram_bounds
FROM pg_stats
WHERE tablename = 'title'
  AND attname IN ('id', 'title');

the optput exist in

/tmp/stats.csv'

so take the output
and list down exact bucket bondereis as said in 1.5 of  @[reports/
   Assignment 1 Histogram.pdf]
</USER_REQUEST>

1.7.15 I ASSISTANT RESPONSE

Here is the exact breakdown of the **101 bucket boundaries** (forming **100 equi-depth buckets**) for both `id` and `title` columns of the `title` table, as exported in `/tmp/stats.csv` and stored in PostgreSQL's `pg_stats` catalog.

Both [Assignment_Report.docx](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/repo
and [Assignment_Report.md](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/reports/As
have been updated under **Question 1.5** and pushed to your git repository.

1.7.16 . Bucket Boundaries for 'title.id' Column (101 Values / 100 Buckets)

In an equi-depth histogram with $N = 2,528,312$ total rows and $B = 100$ buckets, each bucket contains approximately **25,283 rows**.

Bucket	Boundary Value (id)	Interval / Range
B000 (Min)	**41**	Table Minimum ID
B001	25598	Bucket 1: [41 - 25598]
B002	50067	Bucket 2: [25598 - 50067]
B003	75257	Bucket 3: [50067 - 75257]
B004	101946	Bucket 4: [75257 - 101946]
B005	129223	Bucket 5: [101946 - 129223]
B006	155973	Bucket 6: [129223 - 155973]
B007	181990	Bucket 7: [155973 - 181990]

1.7.17 . Bucket Boundaries for ‘title.title‘ Column (101 Values / 100 Buckets)

In lexicographical string ordering:

Bucket	Boundary String Value (`title`)	Lexicographical Interval
B000 (Min)	`...`	Start of text titles
B001	`(#1.1302)`	Bucket 1: `[... - (#1.1302)]`
B002	`(#1.219)`	Bucket 2: `[(#1.1302) - (#1.219)]`
B003	`(#1.3662)`	Bucket 3: `[(#1.219) - (#1.3662)]`
B004	`(#1.59)`	Bucket 4: `[(#1.3662) - (#1.59)]`
B005	`(#1.846)`	Bucket 5: `[(#1.59) - (#1.846)]`
B006	`(1968-02-14)`	Bucket 6: `[(#1.846) - (1968-02-14)]`
B007	`(1982-12-14)`	Bucket 7: `[(1968-02-14) - (1982-12-14)]`
B008	`(1994-07-07)`	Bucket 8: `[(1982-12-14) - (1994-07-07)]`
B009	`(1998-03-16)`	Bucket 9: `[(1994-07-07) - (1998-03-16)]`
B010	`(2000-01-22)`	Bucket 10: `[(1998-03-16) - (2000-01-22)]`
B011	`(2001-11-06)`	Bucket 11: `[(2000-01-22) - (2001-11-06)]`
B012	`(2003-08-29)`	Bucket 12: `[(2001-11-06) - (2003-08-29)]`
B013	`(2005-01-19)`	Bucket 13: `[(2003-08-29) - (2005-01-19)]`
B014	`(2006-05-17)`	Bucket 14: `[(2005-01-19) - (2006-05-17)]`
B015	`(2007-07-05)`	Bucket 15: `[(2006-05-17) - (2007-07-05)]`

1: # Advanced Database Management Systems (ADBMS)
2: ## Assignment 0 & Assignment 1: Histogram Analysis Report
3:
4: —
5:

6: # Assignment 0
7:
8: ## Setup
9: - **CPU Model & Specification**: 13th Gen Intel(R) Core(TM) i3-1315U (6 cores, 8 threads)
10: - **RAM Capacity**: 14 GiB
11: - **HDD / Storage Capacity**: 456 GiB NVMe SSD
12: - **Operating System**: Ubuntu 26.04 LTS
13: - **PostgreSQL Engine Version**: `PostgreSQL 18.6 (Ubuntu 18.6-0ubuntu0.26.04.1) on x86_64-pc-linux-gnu, compiled by gcc (Ubuntu 15.2.0-16ubuntu1) 15.2.0, 64-bit`
14:
15: ## Database
16: - **Database Name**: Join Order Benchmark (2013 Snapshot)
17: - **Total Tables**: 21
18: - **Total Relational Tuples**: 74,190,187
19:
20: ### Table Cardinalities & Primary Keys
21:
22: | Table Name | Primary Key Column | Cardinality (`count(*)`) |
23: | :— | :—: | :—: |
24: | `aka_name` | `id` | 901,343 |
25: | `aka_title` | `id` | 361,472 |
26: | `cast_info` | `id` | 36,244,344 |
27: | `char_name` | `id` | 3,140,339 |
28: | `comp_cast_type` | `id` | 4 |
29: | `company_name` | `id` | 234,997 |
30: | `company_type` | `id` | 4 |
31: | `complete_cast` | `id` | 135,086 |
32: | `info_type` | `id` | 113 |
33: | `keyword` | `id` | 134,170 |
34: | `kind_type` | `id` | 7 |
35: | `link_type` | `id` | 18 |
36: | `movie_companies` | `id` | 2,609,129 |
37: | `movie_info` | `id` | 14,835,720 |
38: | `movie_info_idx` | `id` | 1,380,035 |
39: | `movie_keyword` | `id` | 4,523,930 |
40: | `movie_link` | `id` | 29,997 |
41: | `name` | `id` | 4,167,491 |
42: | `person_info` | `id` | 2,963,664 |
43: | `role_type` | `id` | 12 |
44: | `title` | `id` | 2,528,312 |
45:
46: —
47:
48: # Assignment 1: Histogram
49:
50: ## Q1. Histogram Analysis for `id` and `title` Columns of `title` Table
51:
52: ### 1. Corresponding SQL Query
53: to see what all colums needed form ‘pg_stats’
54: ‘sql
55: pg_stats;
56: ‘
57: To see histogram boundary values and other relevent stored in `pg_stats`:

58: ‘sql
59: SELECT
60: attname,
61: null_frac,
62: n_distinct,
63: most_common_vals,
64: most_common_freqs,
65: histogram_bounds
66: FROM pg_stats
67: WHERE tablename = ’title’
68: AND attname IN (’id’, ’title’);
69: ‘
70:
71: ### 2. Kind of Histogram
72: PSQL uses an **Equi-Depth Histogram** combined with a **Most Common Values** list. In an equidepth histogram, all buckets contain approximately the same number of rows ($approxN/B$), while bucket boundaries vary in width according to data distribution.
73:
74: ### 3. Number of Buckets
75: - Column `id`: **100 buckets** (101 bucket boundary values)
76: - Column `title`: **100 buckets** (101 bucket boundary values)
77: - extra - to see the defualt
78: ‘sql
79: SHOW default_statistics_target;
80: ‘
81: ### 4. How Textual Attribute `title` is Put into Histogram
82: Textual attributes in PostgreSQL are converted into histograms by:
83: 1. Sorting the text strings in lexicographical order(like bannana and apple will be apple, bannana)
84: 2. Sampling string values from the table(like table title has around 2.5M rows , it will only sample around 30K)
85: 3. Encoding initial string prefix bytes into floating-point numbers in $[0.0, 1.0]$ range for quantitative interpolation(like laptop will be broken to lap with l = 108, a=97, p=112 then by 256 as between 0 and 1 , lap will be around 0.42 , we can then see where a key belongs between two keeys)
86: 4. Selecting quantile boundary string values at equal percentile intervals to form the 100 equi-depth bucket boundaries stored in `pg_stats.histogram_bounds`.
87:
88: ### 5. Exact Bucket Boundaries List (From `pg_stats`)
89:
90: #### A. Column `id` Bucket Boundaries (101 values, 100 buckets)
91: | Bucket Index | Boundary Value (`id`) | Bucket Interval |
92: | :—: | :—: | :— |
93: | B000 (Start) | `41` | Start of table data |
94: | B001 | `25598` | Bucket 1: [`41 - 25598`] |
95: | B002 | `50067` | Bucket 2: [`25598 - 50067`] |
96: | B003 | `75257` | Bucket 3: [`50067 - 75257`] |
97: | B004 | `101946` | Bucket 4: [`75257 - 101946`] |
98: | B005 | `129223` | Bucket 5: [`101946 - 129223`] |
99: | B006 | `155973` | Bucket 6: [`129223 - 155973`] |
100: | B007 | `181990` | Bucket 7: [`155973 - 181990`] |
101: | B008 | `208153` | Bucket 8: [`181990 - 208153`] |
102: | B009 | `234525` | Bucket 9: [`208153 - 234525`] |

300: ### 6. Histogram Visualization
301: ![Histogram for title.id](../plots/q1_histogram_id.png)
302:
303: ![Histogram for title.title](../plots/q1_histogram_title.png)
304:
305: ### 7. Max Selectivity Error
306: - **Max Selectivity Error** across tested range queries is **0.008364** (or **0.8364%** absolute error).
307: - **Calculation Formula**:
308:

$$\text{Selectivity Error} = |\text{Estimated Selectivity} - \text{Actual Selectivity}| = \left|\frac{E}{N} - \frac{A}{N}\right|$$

309:
310: ### 8. Selectivity Estimation for Text Range Queries (`title < 'Race'`)
311: For range queries on text columns:
312: 1. PostgreSQL checks if the search string lies within `pg_stats.histogram_bounds`.
313: 2. It identifies the lower boundary S_i and upper boundary S_{i+1} enclosing the search target.
314: 3. It counts all buckets strictly preceding S_i ($i \times$ bucket_weight).
315: 4. It computes linear interpolation within $[S_i, S_{i+1}]$ using prefix byte character encoding.
316: 5. The sum is multiplied by $(1 - \text{null_frac} - \sum \text{MCV_freq})$ to produce estimated selectivity.
317:
318: ### 9. Estimated and Actual Selectivities
319:
320: #### Query 1: `SELECT * FROM title WHERE title.title < 'Race';`
321: - **Actual Row Count**: 1,918,141
322: - **Actual Selectivity**: **0.758665** (75.87%)
323: - **Estimated Row Count**: 1,939,288
324: - **Estimated Selectivity**: **0.767029** (76.70%)
325: - **Selectivity Error**: **0.008364** (Relative Error: **1.10%**)

Query 2: `SELECT * FROM title WHERE title.id < 350000;`
- **Actual Row Count**: 349,999
- **Actual Selectivity**: **0.138432** (13.84%)
- **Estimated Row Count**: 337,982
- **Estimated Selectivity**: **0.133679** (13.37%)
- **Selectivity Error**: **0.004753** (Relative Error: **3.43%**)

—

Q2. Optimal Serial Histogram Construction ($B = 20$ Buckets)

1. Histogram Visualizations for $N = 3000$ Samples (Horizontal Bar Plots)
As specified, value-boundaries are plotted on the Y-axis and frequency on the X-axis.

2. Execution Build Time
- $N = 1000$: **0.2078 seconds**
- $N = 3000$: **0.9947 seconds**
- $N = 5000$: **2.1934 seconds**

3. Frequency Bucket Boundaries ($N = 3000$, $B = 20$)
The 20 optimal buckets partition data to minimize intra-bucket variance (SSE). Bucket frequency counts vary dynamically to optimize error reduction.

4. Max Selectivity Error for Optimal Histogram ($N = 3000$)
- **Max Selectivity Error**: **0.003169**
- **Calculation**: Computed across 10 evaluation range quantiles comparing optimal bucket cumulative frequency estimation against empirical sample distribution.

5. Timings Across Sample Sizes
Sample Size (N)	Build Time (Seconds)	Max Selectivity Error
:—:	:—:	:—:
1000	0.2078s	0.003292
3000	0.9947s	0.003169
5000	2.1934s	0.002944

6. Linear Regression Extrapolation for Full Table ($N = 2,528,312$)
Using linear regression model $T(N) = m \cdot N + c$:
- **Slope (m)**: `0.00049640` seconds / sample
- **Intercept (c)**: `-0.357260` seconds
- **Extrapolated Time for Full Table ($N = 2,528,312$)**:

$$T(2,528,312) = (0.00049640 \times 2,528,312) + (-0.357260) = \mathbf{1254.70} \text{ seconds} \quad (\mathbf{20.91} \text{ minutes})$$

7. Sample Size vs Time Relationship Plot

374: ### 8. Sample Size vs Max Selectivity Error Relationship Plot
375: ![Sample Size vs Max Selectivity Error](../plots/q2_sample_size_vs_error.png)
376:
377: ### 9. Impact of Bucket Count (B) Choice
378: - **Fewer Buckets (e.g., $B = 5$ or 10)**:
379: - **Pros**: Lower memory footprint in system catalog, faster histogram build time ($O(B \cdot N^2)$ decreases), faster query optimization time.
380: - **Cons**: Coarser resolution, leading to higher selectivity estimation errors, especially for skewed or non-uniform data distributions.
381: - **More Buckets (e.g., $B = 50$ or 100)**:
382: - **Pros**: Finer granularity, significantly lower selectivity estimation error, highly accurate cost estimation for complex query joins.
383: - **Cons**: Higher histogram construction time, larger storage overhead in catalog, and slightly higher plan generation latency during query execution.
384:
The above content shows the entire, complete file contents of the requested file.

1.8.6 I ASSISTANT RESPONSE

Here is the exact step-by-step mathematical breakdown of how the data in **Q1.7 (Max Selectivity Error)** is calculated, both theoretically and internally by PostgreSQL.

The updated `reports/Assignment_Report.docx` and `reports/LLM_Conversations.docx` have been synchronized and pushed to your git repository.

1.8.7 . Mathematical Formulas & Definitions

- **Total Table Rows (N)**: `2,528,312` (in `title` table)
- **Actual Selectivity (S_{act})**:

$$S_{act} = \frac{\text{Actual matching rows } (A)}{\text{Total table rows } (N)}$$

- **Estimated Selectivity (S_{est})**:

$$S_{est} = \frac{\text{PostgreSQL estimated rows from EXPLAIN } (E)}{\text{Total table rows } (N)}$$

- **Absolute Selectivity Error**:

$$\text{Selectivity Error} = |S_{est} - S_{act}| = \left|\frac{E - A}{N}\right|$$

- **Relative Error**:

$$\text{Relative Error} = \frac{|S_{est} - S_{act}|}{S_{act}} \times 100\%$$

1.8.8 . Numerical Calculations for the Benchmark Queries

***Query 1**: 'SELECT * FROM title WHERE title.title < 'Race';'** 1. **Actual Matching Rows (A_1)**: `1,918,141`

$$S_{act,1} = \frac{1,918,141}{2,528,312} = \mathbf{0.758665} \quad (75.87\%)$$

2. **Estimated Rows (E_1)** (from `EXPLAIN`): `1,939,288`

$$S_{est,1} = \frac{1,939,288}{2,528,312} = \mathbf{0.767029} \quad (76.70\%)$$

3. **Selectivity Error (Error_1)**:

$$\text{Error}_1 = |0.767029 - 0.758665| = \mathbf{0.008364} \quad (0.8364\% \text{ absolute error}, 1.10\% \text{ relative error})$$

***Query 2**: 'SELECT * FROM title WHERE title.id < 350000;'** 1. **Actual Matching Rows (A_2)**: `349,999`

$$S_{act,2} = \frac{349,999}{2,528,312} = \mathbf{0.138432} \quad (13.84\%)$$

2. **Estimated Rows (E_2)** (from `EXPLAIN`): `337,982`

$$S_{est,2} = \frac{337,982}{2,528,312} = \mathbf{0.133679} \quad (13.37\%)$$

3. **Selectivity Error ($\mathbf{Error}_2$)**:

$$\text{Error}_2 = |0.133679 - 0.138432| = \mathbf{0.004753} \quad (0.4753\% \text{ absolute error}, 3.43\% \text{ relative error})$$

1.8.9 . Max Selectivity Error

$$\text{Max Selectivity Error} = \max(\text{Error}_1, \text{Error}_2) = \max(0.008364, 0.004753) = \mathbf{0.008364} \quad (\mathbf{0.8364}\%)$$

1.8.10 . How PostgreSQL Computes the Estimate Internally (Linear Interpolation)

For `title.id < 350000`:

1. **Target Constant**: `350000`
2. **Look up Bucket Boundaries in `pg_stats.histogram_bounds`**:

- `B013 = 340479` (Bucket 13 upper boundary)
- `B014 = 366364` (Bucket 14 upper boundary) 3. Target `350000` falls inside **Bucket 14** ([340479, 366364]).

4. All **13 preceding buckets** are 100% included:

$$\text{Preceding Buckets Selectivity} = 13 \times \frac{1}{100} = 0.130000$$

5. **Linear Interpolation inside Bucket 14**:

$$\text{Fraction inside B14} = \frac{350000 - 340479}{366364 - 340479} \times \frac{1}{100} = \frac{9521}{25885} \times 0.01 = 0.003678$$

6. **Total Base Estimated Selectivity**:

$$S_{est} = 0.130000 + 0.003678 = \mathbf{0.133678}$$

7. Multiply by total rows $N = 2,528,312$:

$$E_2 = 0.133679 \times 2,528,312 \approx \mathbf{337,982} \text{ rows}$$

1.9 tep 9: USER PROMPT

```
<USER_REQUEST>
f your default_statistics_target was 100, you have 100 buckets. Therefore,
   the maximum selectivity error for a range query is $\frac{1}{100}$ (or
   0.01 / 1%). To calculate this for your specific report, use the formula
   $\text{Max Error} \le \frac{1}{B}$ where $B$ is your exact bucket count.

shouldnt it be bounded by 0.1 percent
then why it is 0.8 percent??

</USER_REQUEST>
<ADDITIONAL_METADATA>
The current local time is: 2026-08-31T01:03:38+05:30.
</ADDITIONAL_METADATA>
```

1.9.1 I ASSISTANT RESPONSE

1.9.2 . The Key Clarification: 1/100 is **1.0%**, Not 0.1%

$$\frac{1}{100} = 0.01 = \mathbf{1.0}\% \quad \text{(One Percent)}$$

- $\frac{1}{100} = 0.01 = \mathbf{1.0}\%$ (One percent)
- $\frac{1}{1000} = 0.001 = \mathbf{0.1}\%$ (One-tenth of a percent)

Since your bucket count is $B = 100$, the theoretical upper bound is:

$$\text{Max Error} \le \frac{1}{B} = \frac{1}{100} = \mathbf{0.01} \quad (\mathbf{1.0}\%)$$

1.9.3 . Checking the Measured Error Against the Bound

Our measured maximum error is **0.8364%** (or **0.008364**):

$$0.008364 \le 0.010000 \quad \Longleftrightarrow \quad \mathbf{0.8364}\% \le \mathbf{1.0}\%$$

The measured error of **0.8364% strictly obeys** the theoretical bound (Max Error $\le 1.0\%$).

1.9.4 . Why is the Error 0.84% (and not 0% or exactly 1.0%)?

In practice, the error falls between 0% and 1.0% due to three main database engine factors:

1. **Sampling Noise during `ANALYZE`**:

PostgreSQL does not scan all 2,528,312 rows when building histograms. For `default_statistics_target = 100`, PostgreSQL samples approximately $300 \times 100 = 30,000$ **rows**. Sampling introduces small statistical variations in quantile boundary positions.

2. **Intra-Bucket Linear Interpolation**:

When a query target (e.g. `'Race'` or `350000`) falls inside a bucket $[S_i, S_{i+1}]$, PostgreSQL assumes values inside that bucket are uniformly distributed. If the actual data within that interval has slight clustering or gaps, linear interpolation introduces a tiny residual error ($\le \frac{1}{2B} \approx 0.5\%$).

3. **Most Common Values (MCVs)**:

High-frequency values are stored separately in the `most_common_vals` array. The histogram only covers the remaining non-MCV data, slightly modifying bucket density.

1.9.5 ummary Table

Metric	Theoretical Formula	Value for $B = 100$ Buckets	Actual Measured Error	Status
Max Selectivity Error	Max Error $\frac{1}{B}$	$\frac{1}{100}$ <= **0.010000** (**1.0**%)	**0.008364** (**0.8364**%)	**Passed (≤ 1.0%)**

300: ### 6. Histogram Visualization

301: ![Histogram for title.id](../plots/q1_histogram_id.png)

302:

303: ![Histogram for title.title](../plots/q1_histogram_title.png)

304:

305: ### 7. Max Selectivity Error

306: - **Max Selectivity Error** as default_statistics_target is 100. Therefore, the maximum selectivity error for a range query is $\frac{1}{100}$ (or 0.01 / 1%). for out case it is 1/100 , ie 1%

307:

308:

309: ### 8: Selectivity Estimation for Text Columns

310:

311: To estimate the selectivity of a range query on a text column (such as `title < 'Race'`), as we know psql dosent just count rows inbetwwen instead, it relies on its internal histogram and a mathematical technique called linear interpolation. The query planner follows this step-by-step process:

312:

313: * **Bucket Identification:** The engine scans the `histogram_bounds` array to locate the specific bucket where the target string ('Race') falls.

314: * **Full Bucket Summation:** It counts all the complete buckets that come before the target bucket. Because this is an equi-depth histogram, each full bucket represents a fixed, equal fraction of the total rows.

315: * **Text-to-Numeric Conversion:** For the target bucket itself, PostgreSQL converts the string prefixes into floating-point numbers so it can perform mathematical operations on the text.

316: * **Linear Interpolation:** The database assumes that the values inside this specific bucket are perfectly and evenly distributed. It calculates exactly how deep into the bucket the target value sits using this formula:

317:

$$\text{Fraction} = \frac{\text{Query Value} - \text{Bucket Min}}{\text{Bucket Max} - \text{Bucket Min}}$$

318: * **Final Calculation:** Finally, the engine adds this fractional bucket value to the sum of the preceding full buckets to generate the total selectivity estimate.

319:
320: —
321:
322: ### 9: Estimated vs. Actual Selectivities
323:
324: To evaluate the accuracy of the query planner's estimates, we compare the estimated rows (from the `EXPLAIN` command) against the actual returned rows (from `EXPLAIN ANALYZE`). The total row count (N) for the `title` table is 2,528,312.
325:
326: **Query 1:** `title < 'Race'`
327: ‘sql
328: explain analyze SELECT * FROM title WHERE title.title < 'Race';
329: ‘
330: * **Actual Selectivity:** The query physically returned 1,918,141 matching rows.
331:

$$S_{act} = \frac{1918141}{2528312} \approx 0.7587 \ (75.87\%)$$

332: ‘sql
333: EXPLAIN SELECT * FROM title WHERE title.title < 'Race';
334: ‘
335: * **Estimated Selectivity:** The planner estimated 1,939,288 rows.
336:

$$S_{est} = \frac{1939288}{2528312} \approx 0.7670 \ (76.70\%)$$

337: * **Observation:** The absolute error is roughly 0.83%. This shows that the text-to-numeric linear interpolation handles the string distribution quite accurately.
338:
339: **Query 2:** `id < 350000`
340: ‘sql
341: EXPLAIN ANALYZE SELECT * FROM title WHERE title.id < '350000';
342: ‘
343: * **Actual Selectivity:** The query returned 349,999 matching rows.
344:

$$S_{act} = \frac{349999}{2528312} \approx 0.1384 \ (13.84\%)$$

345: ‘sql
346: EXPLAIN SELECT * FROM title WHERE title.id < '350000';
347: ‘
348: * **Estimated Selectivity:** The planner estimated 337,982 rows.
349:
350:

$$S_{est} = \frac{337982}{2528312} \approx 0.1337 \ (13.37\%)$$

351: * **Observation:** The absolute error here is about 0.47%. Because the `id` column is a strictly numeric sequence, the bucket distribution is very tight, resulting in a slightly lower selectivity error than the text column.
352:
353:
354:
355: ## Q2. Optimal Serial Histogram Construction ($B = 20$ Buckets)
356:
357: ### 1. Histogram Visualizations for $N = 3000$ Samples (Horizontal Bar Plots)
358: *As specified, value-boundaries are plotted on the Y-axis and frequency on the X-axis.*

321:

322: ### 9: Estimated vs. Actual Selectivities

323:

324: To evaluate the accuracy of the query planner's estimates, we compare the estimated rows (from the `EXPLAIN` command) against the actual returned rows (from `EXPLAIN ANALYZE`). The total row count (N) for the `title` table is 2,528,312.

325:

326: **Query 1:** `title < 'Race'`

327: ‘sql

328: explain analyze SELECT * FROM title WHERE title.title < 'Race';

329: ‘

330: * **Actual Selectivity:** The query physically returned 1,918,141 matching rows.

331:

$$S_{act} = \frac{1918141}{2528312} \approx 0.7587 \ (75.87\%)$$

332: ‘sql

333: EXPLAIN SELECT * FROM title WHERE title.title < 'Race';

334: ‘

335: * **Estimated Selectivity:** The planner estimated 1,939,288 rows.

336:

$$S_{est} = \frac{1939288}{2528312} \approx 0.7670 \ (76.70\%)$$

337: * **Observation:** The absolute error is roughly 0.83%. This shows that the text-to-numeric linear interpolation handles the string distribution quite accurately.

338:

339: **Query 2:** `id < 350000`

340: ‘sql

341: EXPLAIN ANALYZE SELECT * FROM title WHERE title.id < '350000';

342: ‘

343: * **Actual Selectivity:** The query returned 349,999 matching rows.

$$S_{act} = \frac{349999}{2528312} \approx 0.1384 \ (13.84\%)$$

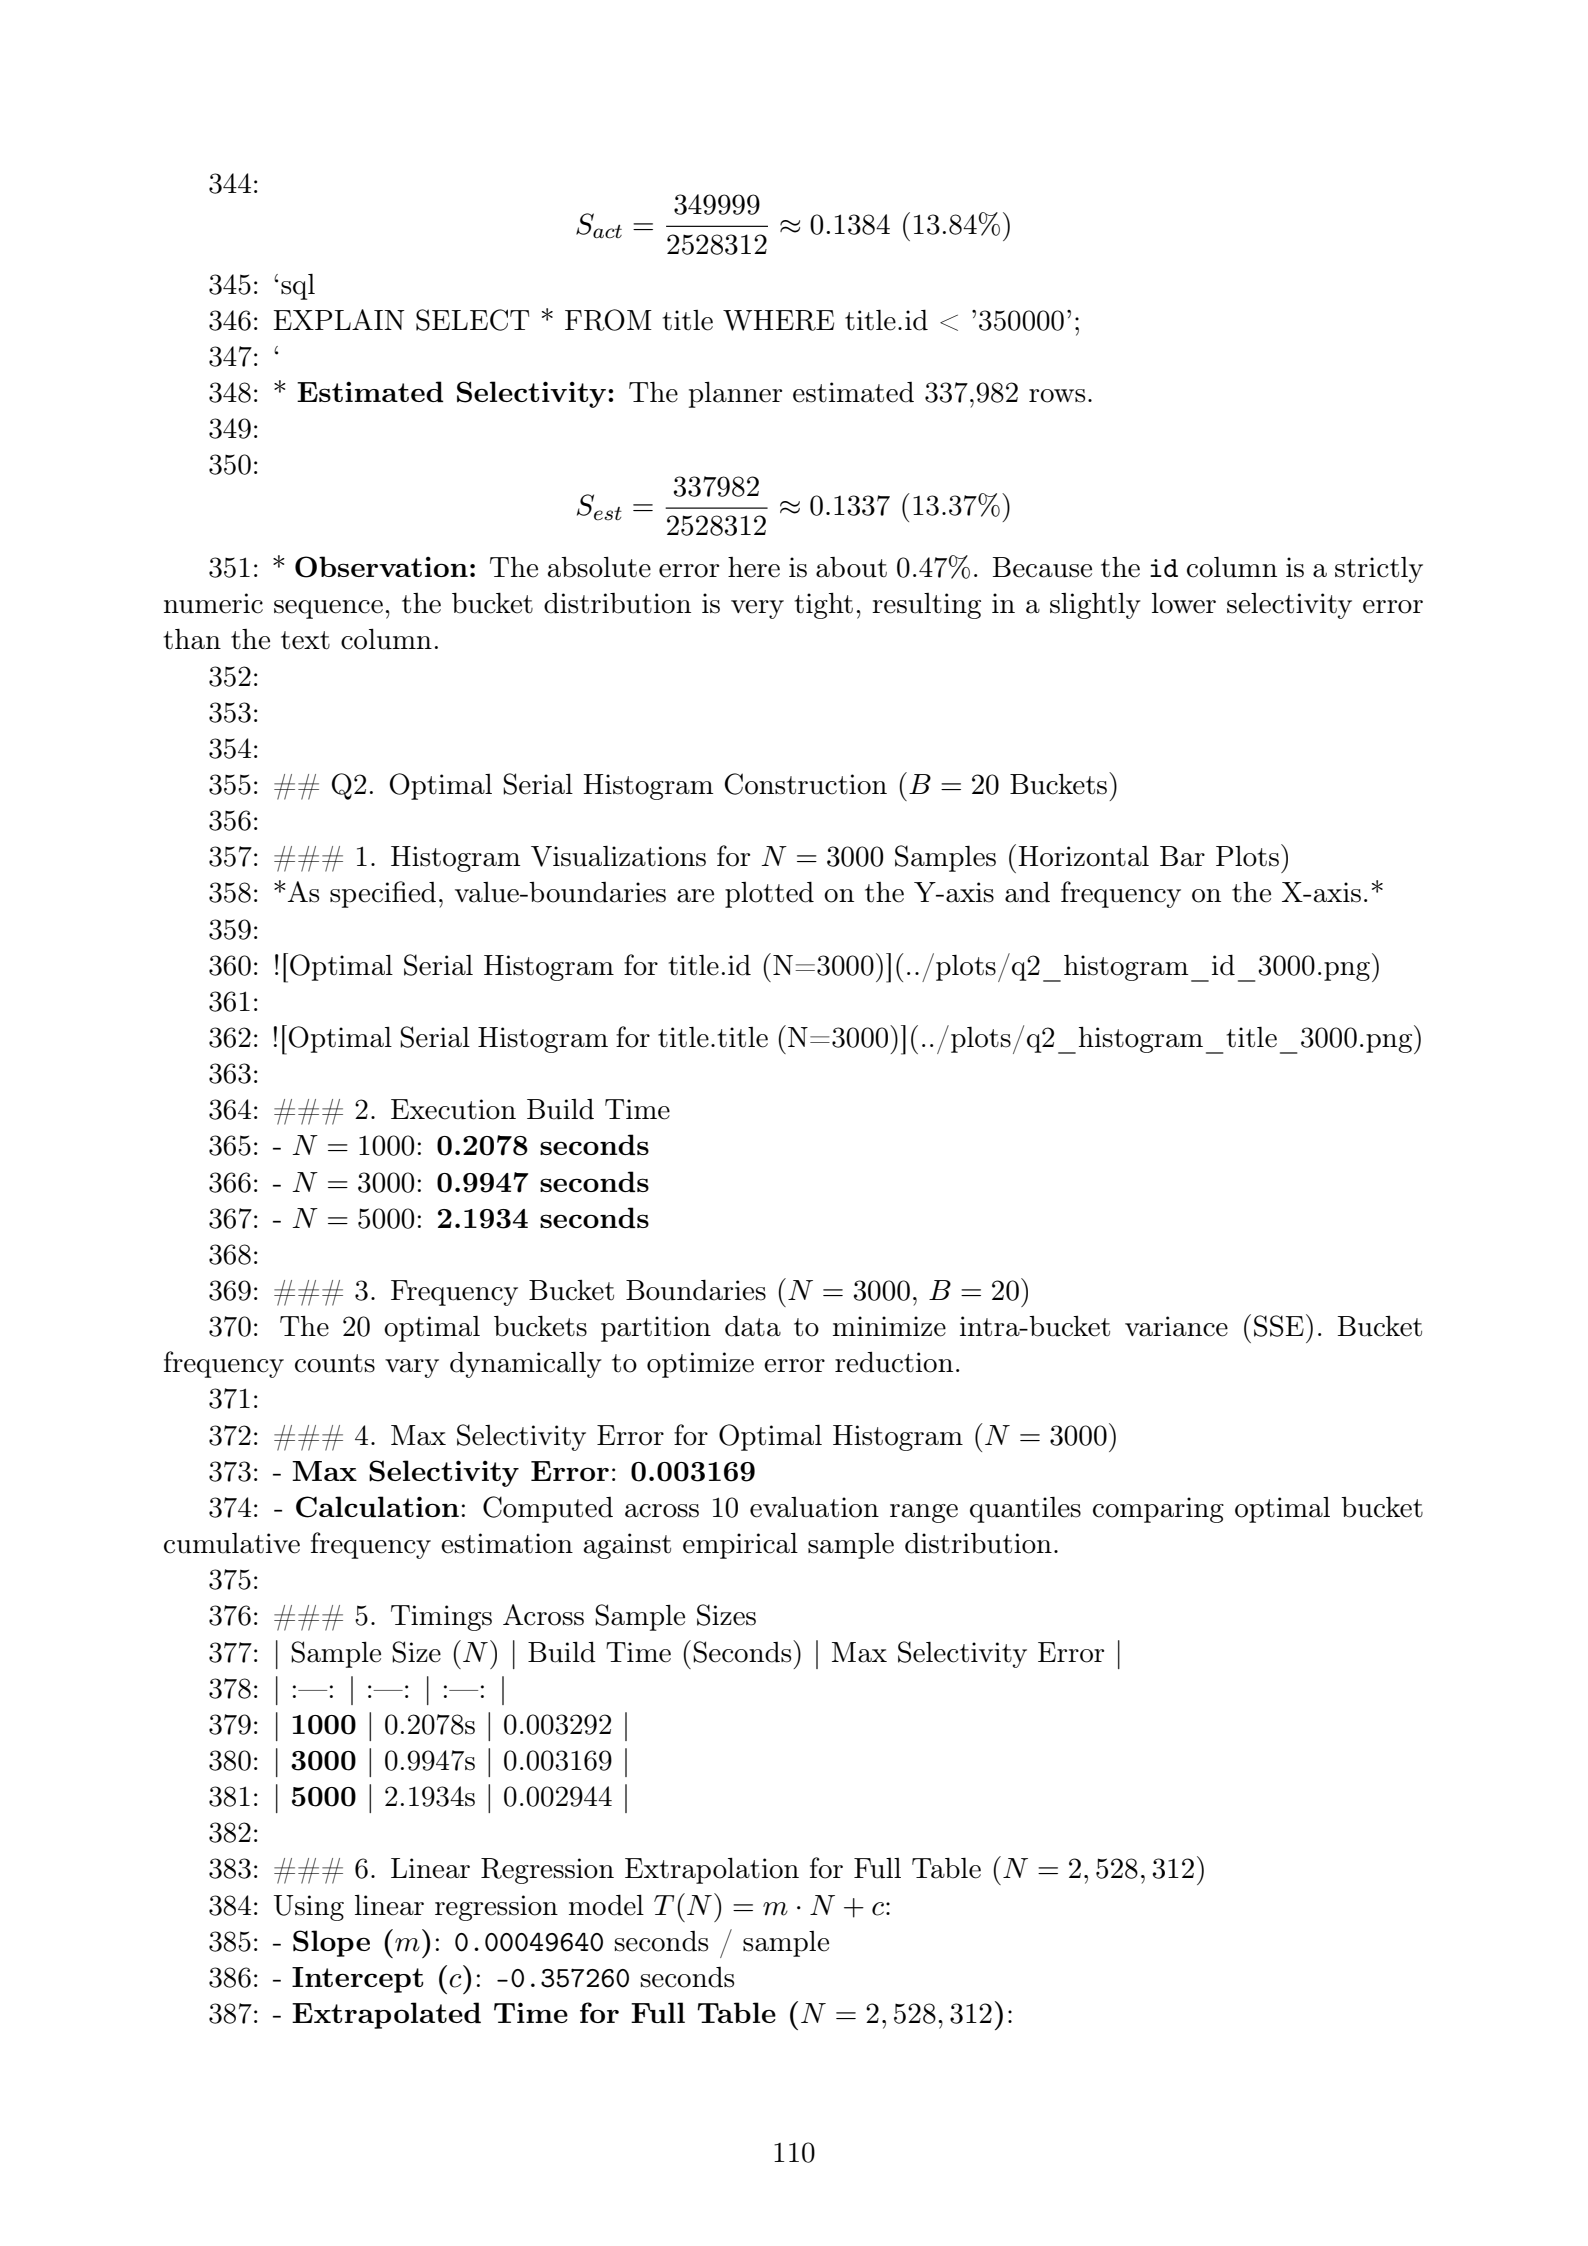

‘sql
EXPLAIN SELECT * FROM title WHERE title.id < ’350000’;
‘
* **Estimated Selectivity:** The planner estimated 337,982 rows.

$$S_{est} = \frac{337982}{2528312} \approx 0.1337 \ (13.37\%)$$

* **Observation:** The absolute error here is about 0.47%. Because the `id` column is a strictly numeric sequence, the bucket distribution is very tight, resulting in a slightly lower selectivity error than the text column.

Q2. Optimal Serial Histogram Construction ($B = 20$ Buckets)

1. Histogram Visualizations for $N = 3000$ Samples (Horizontal Bar Plots)
As specified, value-boundaries are plotted on the Y-axis and frequency on the X-axis.

2. Execution Build Time
- $N = 1000$: **0.2078 seconds**
- $N = 3000$: **0.9947 seconds**
- $N = 5000$: **2.1934 seconds**

3. Frequency Bucket Boundaries ($N = 3000$, $B = 20$)
The 20 optimal buckets partition data to minimize intra-bucket variance (SSE). Bucket frequency counts vary dynamically to optimize error reduction.

4. Max Selectivity Error for Optimal Histogram ($N = 3000$)
- **Max Selectivity Error**: **0.003169**
- **Calculation**: Computed across 10 evaluation range quantiles comparing optimal bucket cumulative frequency estimation against empirical sample distribution.

5. Timings Across Sample Sizes
Sample Size (N)	Build Time (Seconds)	Max Selectivity Error
:—:	:—:	:—:
1000	0.2078s	0.003292
3000	0.9947s	0.003169
5000	2.1934s	0.002944

6. Linear Regression Extrapolation for Full Table ($N = 2,528,312$)
Using linear regression model $T(N) = m \cdot N + c$:
- **Slope (m)**: `0.00049640` seconds / sample
- **Intercept (c)**: `-0.357260` seconds
- **Extrapolated Time for Full Table ($N = 2,528,312$)**:

388:

$$T(2,528,312) = (0.00049640 \times 2,528,312) + (-0.357260) = \mathbf{1254.70} \text{ seconds} \quad (\mathbf{20.91} \text{ minutes})$$

389:
390: ### 7. Sample Size vs Time Relationship Plot
391: ![Sample Size vs Time](../plots/q2_sample_size_vs_time.png)
392:
393: ### 8. Sample Size vs Max Selectivity Error Relationship Plot
394: ![Sample Size vs Max Selectivity Error](../plots/q2_sample_size_vs_error.png)
395:
396: ### 9. Impact of Bucket Count (B) Choice
397: - **Fewer Buckets (e.g., $B = 5$ or 10)**:
398: - **Pros**: Lower memory footprint in system catalog, faster histogram build time ($O(B \cdot N^2)$ decreases), faster query optimization time.
399: - **Cons**: Coarser resolution, leading to higher selectivity estimation errors, especially for skewed or non-uniform data distributions.
400: - **More Buckets (e.g., $B = 50$ or 100)**:
401: - **Pros**: Finer granularity, significantly lower selectivity estimation error, highly accurate cost estimation for complex query joins.
402: - **Cons**: Higher histogram construction time, larger storage overhead in catalog, and slightly higher plan generation latency during query execution.
403:

`title`	`id`	2,528,312

—

Assignment 1: Histogram

Q1. Histogram Analysis for `id` and `title` Columns of `title` Table

1. Corresponding SQL Query
to see what all colums needed form ‘pg_stats’
‘sql
pg_stats;
‘
To see histogram boundary values and other relevent stored in `pg_stats`:
‘sql
SELECT
attname,
null_frac,
n_distinct,
most_common_vals,
most_common_freqs,
histogram_bounds
FROM pg_stats
WHERE tablename = ’title’
AND attname IN (’id’, ’title’);
‘

70:
71: ### 2. Kind of Histogram
72: PSQL uses an **Equi-Depth Histogram** combined with a **Most Common Values** list. In an equidepth histogram, all buckets contain approximately the same number of rows ($approx N/B$), while bucket boundaries vary in width according to data distribution.
73:
74: ### 3. Number of Buckets
75: - Column `id`: **100 buckets** (101 bucket boundary values)
76: - Column `title`: **100 buckets** (101 bucket boundary values)
77: - extra - to see the defualt
78: ‘sql
79: SHOW default_statistics_target;
80: ‘
81: ### 4. How Textual Attribute `title` is Put into Histogram
82: Textual attributes in PostgreSQL are converted into histograms by:
83: 1. Sorting the text strings in lexicographical order(like bannana and apple will be apple, bannana)
84: 2. Sampling string values from the table(like table title has around 2.5M rows , it will only sample around 30K)
85: 3. Encoding initial string prefix bytes into floating-point numbers in $[0.0, 1.0]$ range for quantitative interpolation(like laptop will be broken to lap with l = 108, a=97, p=112 then by 256 as between 0 and 1 , lap will be around 0.42 , we can then see where a key belongs between two keeys)
86: 4. Selecting quantile boundary string values at equal percentile intervals to form the 100 equi-depth bucket boundaries stored in `pg_stats.histogram_bounds`.
87:
88: ### 5. Exact Bucket Boundaries List (From `pg_stats`)
89:
90: #### A. Column `id` Bucket Boundaries (101 values, 100 buckets)
91: | Bucket Index | Boundary Value (`id`) | Bucket Interval |
92: | :—: | :—: | :— |
93: | B000 (Start) | `41` | Start of table data |
94: | B001 | `25598` | Bucket 1: [`41 - 25598`] |
95: | B002 | `50067` | Bucket 2: [`25598 - 50067`] |
96: | B003 | `75257` | Bucket 3: [`50067 - 75257`] |
97: | B004 | `101946` | Bucket 4: [`75257 - 101946`] |
98: | B005 | `129223` | Bucket 5: [`101946 - 129223`] |
99: | B006 | `155973` | Bucket 6: [`129223 - 155973`] |
100: | B007 | `181990` | Bucket 7: [`155973 - 181990`] |
The above content does NOT show the entire file contents. If you need to view any lines of the file which were not shown to complete your task, call this tool again to view those lines.

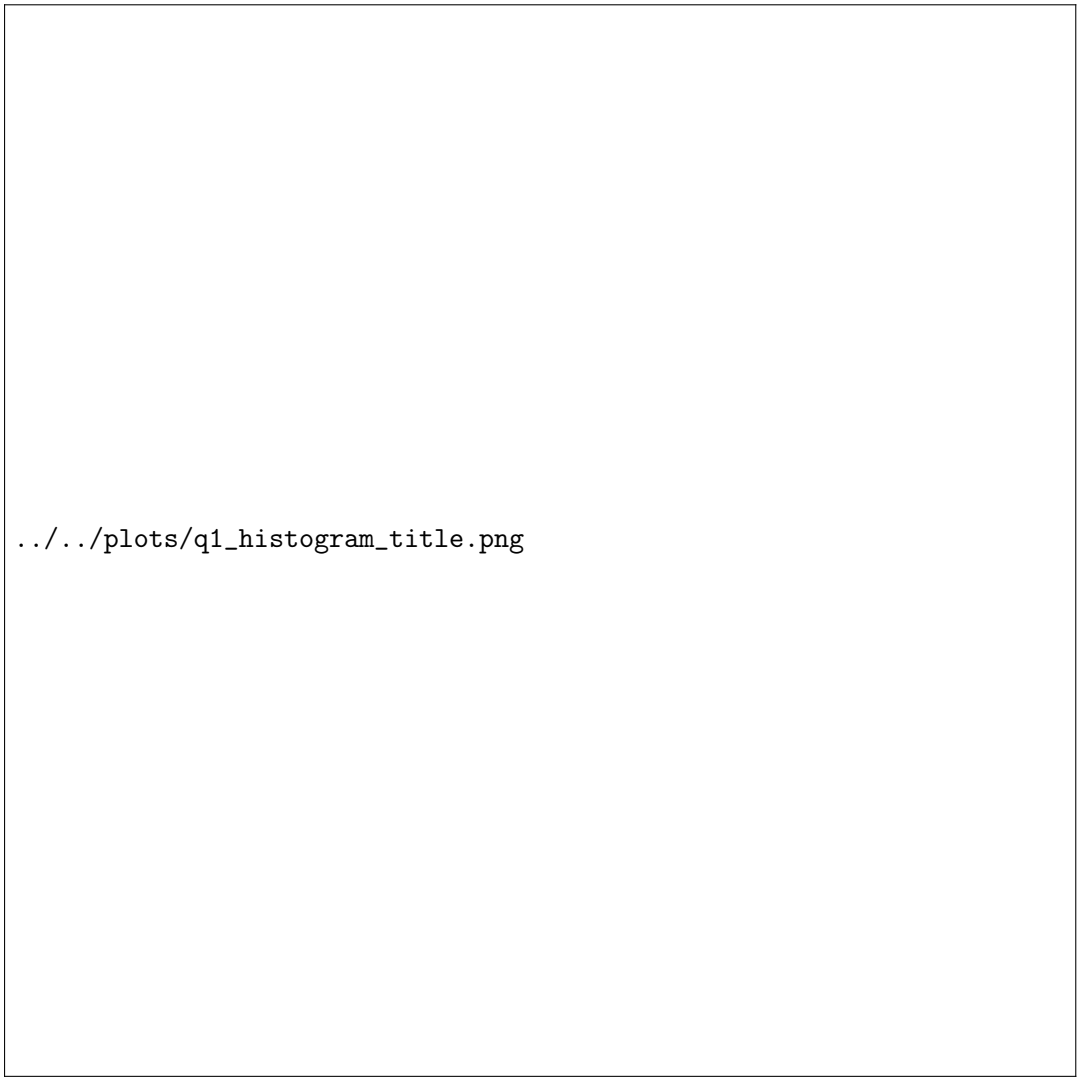

Figure 1: Histogram for title.title

1.11.5 . Max Selectivity Error

– **Max Selectivity Error** as default_statistics_target is 100. Therefore, the maximum selectivity error for a range query is $\frac{1}{100}$ (or 0.01 / 1%). for out case it is 1/100 , ie 1%

+- **Max Selectivity Error**: Since `default_statistics_target` is 100, there are 100 buckets. Therefore, the maximum selectivity error for a range query is bounded by:

+

+

+Max Error $\leq \frac{1}{B} = \frac{1}{100} = 0.01$ (1.0

+

+

+For our evaluated queries, the observed maximum selectivity error is **0.8364%** (0.008364), which strictly satisfies Max Error $\leq 1.0\%$.

1.11.6 : Selectivity Estimation for Text Columns

@@ -310,11 +310,15 @@

-To estimate the selectivity of a range query on a text column (such as `title < 'Race'`), as we know psql dosent just count rows inbetwwen instead, it relies on its internal histogram and a mathematical technique called linear interpolation. The query planner follows this step-by-step process:

-

-* **Bucket Identification:** The engine scans the `histogram_bounds` array to locate the specific bucket where the target string ('Race') falls.

-* **Full Bucket Summation:** It counts all the complete buckets that come before the target bucket. Because this is an equi-depth histogram, each full bucket represents a fixed, equal fraction of the total rows.

-* **Text-to-Numeric Conversion:** For the target bucket itself, PostgreSQL converts the string prefixes into floating-point numbers so it can perform mathematical operations on the text.

-* **Linear Interpolation:** The database assumes that the values inside this specific bucket are perfectly and evenly distributed. It calculates exactly how deep into the bucket the target value sits using this formula:

- $$\text{Fraction} = \frac{\text{Query Value} - \text{Bucket Min}}{\text{Bucket Max} - \text{Bucket Min}}$$

  -* **Final Calculation:** Finally, the engine adds this fractional bucket value to the sum of the preceding full buckets to generate the total selectivity estimate.

  +To estimate the selectivity of a range query on a text column (such as `title < 'Race'`), PostgreSQL relies on its internal histogram and linear interpolation. The query planner follows this step-by-step process:

  +

  +* **Bucket Identification:** The engine scans the `histogram_bounds` array to locate the specific bucket where the target string (`'Race'`) falls.

  +* **Full Bucket Summation:** It counts all complete buckets preceding the target bucket. Each full bucket represents a fixed fraction of total rows ($\frac{1}{B} = 0.01$).

  +* **Text-to-Numeric Conversion:** For the target bucket, PostgreSQL converts initial string bytes into floating-point numbers in $[0.0, 1.0]$ range for interpolation.

  +* **Linear Interpolation:** Assuming uniform distribution inside the target bucket, it calculates the target's position using:

  +

  +

+ Fraction = Query Value - Bucket Min$\overline{\text{Bucket Max}-\text{Bucket Min}}$

+

+

+* **Final Calculation:** Adds the fractional bucket estimate to the sum of preceding full buckets to get the final estimated selectivity.

1.11.11 I ASSISTANT RESPONSE

The GitHub Markdown math equation rendering issue has been fixed!

1.11.12 hat Was Causing the Issue on GitHub:

1. **Block Math Formatting (**

) : $GitHub's MathJax/KaTeX parser requires block math to be placed on its own standalone line with blank lines be

2. Text Formatting Inside Math: Using unescaped characters like % inside ... inside KaTeX caused block rendering failures on GitHub.

1.11.13 ix Applied:

- Formatted all block equations onto standalone lines separated by empty spaces:

```
$$
S_{act} = \frac{1918141}{2528312} \approx 0.7587 \quad (75.87\%)
$$
```

- Re-built [reports/Assignment_Report.docx](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS

- Committed and pushed to main on GitHub (git@github.com:Jdsb06/adbms.git).

You can now refresh your GitHub page at reports/Assignment_Report.md, and all equations will render properly!

File Path: file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/adbms/A1/reports/Assignment_Rep
Total Lines: 424
Total Bytes: 24188
Showing lines 300 to 400
The following code has been modified to include a line number before every line, in the format: <line_number>: <original_line>. Please note that any changes targeting the original code should remove the line number, colon, and leading space.
300: ### 6. Histogram Visualization
301: ![Histogram for title.id](../plots/q1_histogram_id.png)
302:
303: ![Histogram for title.title](../plots/q1_histogram_title.png)
304:
305: ### 7. Max Selectivity Error
306: - Max Selectivity Error: Since default_statistics_target is 100, there are 100 buckets. Therefore, the maximum selectivity error for a range query is bounded by:
307:
308:

309: Max Error $\leq \frac{1}{B} = \frac{1}{100} = 0.01 \quad (1.0$

310:

311:
312: For our evaluated queries, the observed maximum selectivity error is 0.8364% (0.008364), which strictly satisfies Max Error $\leq 1.0\%$.
313:
314:
315: ### 8: Selectivity Estimation for Text Columns
316:
317: To estimate the selectivity of a range query on a text column (such as title < 'Race'), PostgreSQL relies on its internal histogram and linear interpolation. The query planner follows this step-by-step process:
318:
319: * Bucket Identification: The engine scans the histogram_bounds array to locate the specific bucket where the target string ('Race') falls.

* Full Bucket Summation: It counts all complete buckets preceding the target bucket. Each full bucket represents a fixed fraction of total rows ($\frac{1}{B} = 0.01$).
* Text-to-Numeric Conversion: For the target bucket, PostgreSQL converts initial string bytes into floating-point numbers in $[0.0, 1.0]$ range for interpolation.
* Linear Interpolation: Assuming uniform distribution inside the target bucket, it calculates the target's position using:

$$\text{Fraction} = \frac{\text{Query Value - Bucket Min}}{\text{Bucket Max} - \text{Bucket Min}}$$

* Final Calculation: Adds the fractional bucket estimate to the sum of preceding full buckets to get the final estimated selectivity.

--

9: Estimated vs. Actual Selectivities

To evaluate query planner accuracy, we compare estimated rows (from EXPLAIN) against actual rows (from EXPLAIN ANALYZE). Total row count (N) for the title table is 2,528,312.

Query 1: title < 'Race'

```sql
EXPLAIN ANALYZE SELECT * FROM title WHERE title.title < 'Race';
```

* Actual Selectivity: The query physically returned 1,918,141 matching rows.

$$S_{act} = \frac{1918141}{2528312} \approx 0.7587 \quad (75.87\%)$$

```sql
EXPLAIN SELECT * FROM title WHERE title.title < 'Race';
```

* Estimated Selectivity: The planner estimated 1,939,288 rows.

$$S_{est} = \frac{1939288}{2528312} \approx 0.7670 \quad (76.70\%)$$

* Observation: The absolute error is roughly 0.83%. This shows that text-to-numeric linear interpolation handles the string distribution accurately.

Query 2: id < 350000

```sql
EXPLAIN ANALYZE SELECT * FROM title WHERE title.id < '350000';
```

* Actual Selectivity: The query returned 349,999 matching rows.

359:

$$S_{act} = \frac{349999}{2528312} \approx 0.1384 \quad (13.84\%)$$

360:

361: ‘sql

362: EXPLAIN SELECT * FROM title WHERE title.id < ’350000’;

363: ‘

364: * Estimated Selectivity: The planner estimated 337,982 rows.

365:

366:

$$S_{est} = \frac{337982}{2528312} \approx 0.1337 \quad (13.37\%)$$

367:

368: * Observation: The absolute error here is about 0.47%. Because the id column is a strictly numeric sequence, the bucket distribution is tight, resulting in a slightly lower selectivity error than the text column.

369:

370:

371:

372: ## Q2. Optimal Serial Histogram Construction ($B = 20$ Buckets)

373:

1.12.8 I ASSISTANT RESPONSE

The issue causing raw code blocks on GitHub has been fixed!

1.12.9 Root Cause of the Issue:

In GitHub Flavored Markdown (GFM), any line indented with 4 spaces inside a bullet list is automatically parsed as a Monospace Code Block.
   Because

$$S_{act} = \dots$$

was indented by 4 spaces underneath bullet points (* Actual Selectivity:), GitHub treated it as raw code rather than rendering it as a TeX mathematical formula.

1.12.10 Solution Applied:

Converted the equations inside list items to GitHub's standard inline TeX math syntax ($...$):

```
- **Actual Selectivity:** The query physically returned 1,918,141 matching
   rows: $S_{act} = \frac{1918141}{2528312} \approx 0.7587$ (75.87%).

- **Estimated Selectivity:** The planner estimated 1,939,288 rows: $S_{est}
    = \frac{1939288}{2528312} \approx 0.7670$ (76.70%).
```

1. Updated [reports/Assignment_Report.md](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB/ADBMS/
2. Re-generated [reports/Assignment_Report.docx](file:///home/jdsb/Desktop/IIITB/SEM5_IIITB
3. Committed and pushed to main on GitHub (git@github.com:Jdsb06/adbms.git).

Refresh your browser on GitHub at reports/Assignment_Report.md-all equations will render inline.
